🚀 Team Setup Guide: Community Donation Management System

To run the project, every team member must follow these steps to ensure the **UI and UI functions** operate correctly.

1. Prerequisite: Install Apache Tomcat

1. **Download:** Go to the Apache Tomcat 10 website and download the **"64-bit Windows zip"** (version 10.1.x).
2. **Extract:** Unzip the folder to a permanent location, such as C:\apache-tomcat-10.1.52. **Do not** delete this folder.

2. Import the Project into IntelliJ

1. **Open IntelliJ IDEA** (Community or Ultimate).
2. Select **Open** and navigate to the project folder you were sent.
3. Wait for the IDE to index the files.

3. Install the "Smart Tomcat" Plugin

Since we are using Java EE features like **Servlets and JSPs**:

1. Go to **File > Settings > Plugins**.
2. Search for **"Smart Tomcat"** and click **Install**.
3. Restart IntelliJ if prompted.

4. Configure the Libraries (Jar Files)

To avoid errors in the Java code (like red underlines on HttpServlet), you must link the Tomcat libraries:

1. Go to **File > Project Structure > Modules**.
2. Click the **Dependencies** tab, then the **+** (plus) icon > **JARs or Directories**.
3. Navigate to your Tomcat folder: ...\apache-tomcat-10.1.52\lib.
4. Select **catalina.jar**, **servlet-api.jar**, and **jsp-api.jar**.
5. Click **OK** and ensure the scope is set to **Provided**.

5. Create the Run Configuration

1. Click **Add Configuration** (top right) > **+** > **Smart Tomcat**.

2. **Tomcat Server:** Browse to your main Tomcat folder.
3. **Deployment Directory:** Browse to [Project_Folder]\src\main\webapp.
4. **Context Path:** Type / (This is mandatory).
5. Click **Apply** and **OK**.
